Customer Reviews

To explain my review title, I'll start with a mild (quite mild) spoiler alert: the advance team heading to the planet gets stranded there, and not all in the same place. The problem I have with the setup is that the issues experienced by the crew on their orbital insertion are myriad, as in every-single-thing-that-could-theoretically-go-wrong-goes-wrong. A lot of this is just crap design and maintenance of their equipment: they don't bother actually testing inflatable air brakes and expect

them to work more than 60 years later (poof); fire suppression systems fail miserably when a comm line fails half a ship away (this wouldn't pass the Florida building code in 2016); fuel lines keep pumping despite a massive breach mid-ship causing a roaring inferno (auto-shut valves have existed for decades); multiple levels of comms gear simultaneously fail at the same time (OK, perfectly believable assuming Comcast built that part of the mission); etc. In short, these colonists didn't suffer bad luck. They suffered from an extreme case of inadequacy wrapped in a warm blanket of sure-minded stupidity and general incompetence. Failure was not only an option - it was built in from day one. They got what was coming to them. Maybe the orbital-entry scene was supposed to be suspenseful and action-packed, but as an engineer all I could do was shake my head and want to toss the program management team behind the mission out an airlock. I groaned all the way through. I'll fast-forward and limit spoilers other than to say the prologue gave away pretty much any surprise the author attempted to preserve.
